

Installation and upgrade quick-start

New install or upgrade from an older Workbench, R, or VisionEval setup

What do I already have?

What you have	What to do in Workbench 2.0
No usable runtime	Choose Install R 4.5.3 + VisionEval RC7 . Workbench downloads and verifies both components when you choose this option.
R 4.5.x + RC7	Connect the existing VE_RUNTIME , VE_HOME , and Rscript.exe , then select Verify runtime . A matching, complete installation need not be installed again.
R 4.5.x + older VE	Workbench can reuse R 4.5.x, but older VisionEval does not pass RC7 verification. Install RC7 in the selected VE_HOME ; use separate target folders if the old setup must remain usable.
Older R series	The managed setup installs R 4.5.3 for your Windows account and leaves the older R installation in place. It then installs the RC7 library for R 4.5.

Keep the old setup

Before upgrading, note your existing **VE_RUNTIME**, **VE_HOME**, **Rscript.exe**, and workspace locations. Installing RC7 into an existing **VE_HOME** can replace its **R 4.5** VisionEval library. To retain the earlier runtime, choose different **VE_RUNTIME** and **VE_HOME** folders for 2.0. Do not delete the old workspace or uninstall old R.

Starting fresh

- 1 Download the Windows 11 x64 Workbench installer from [the Workbench installers page](#) and run the EXE. The EXE installs Workbench, **not** R or VisionEval.
- 2 Launch Workbench and choose a workspace. A new workspace is empty; it is separate from the application and the runtime. If you already have a workspace, choose **Open existing workspace** instead.
- 3 In first-run setup or **Settings > Runtime**, choose **Install R 4.5.3 + VisionEval RC7**. This optional action downloads the certified components, installs them for your Windows account, and verifies the result. Internet access is required for this path.
- 4 Wait for **Native VisionEval ready**. Then install the regional/model package you need in **Settings > Assets**; the runtime alone does not supply your project's input data.

Upgrading an existing setup

Keep your workspace and decide whether to reuse or preserve your earlier runtime.

- 1 Finish or stop active model runs and close the older Workbench. Record the workspace and runtime locations before installing 2.0.
- 2 Install the current Windows 2.0 EXE from [the Workbench installers page](#), then launch it. If asked for a workspace, use **Open existing workspace**; do not create a new empty one when you want your existing projects and results.
- 3 Open **Settings > Runtime**. Inspect **VE_RUNTIME** (working folder), **VE_HOME** (package library), and **Rscript.exe** (R executable) separately. Correct any path Workbench detected incorrectly.
- 4 If those paths lead to R 4.5.x and the certified VE-40-RC7 library, choose **Verify runtime**. If verification fails because VisionEval is older, choose **Install R 4.5.3 + VisionEval RC7**. If you want the previous runtime intact, select separate target VE_RUNTIME and VE_HOME folders before installing.
- 5 The managed setup may reuse an existing R 4.5.x. If you only have an older R series, it installs R 4.5.3 for the current user instead; it does not uninstall the older R. The RC7 files are downloaded and verified during setup.
- 6 Continue only when Workbench reports **Native VisionEval ready**. Check that your existing projects appear, confirm the needed packages are installed in **Settings > Assets**, and run a small test before relying on older projects or results.

If setup does not complete

No paths found	Use Detect again or select VE_RUNTIME, VE_HOME, and Rscript.exe independently. An older installation may be present but not certified for 2.0.
Paths rejected	VE_RUNTIME and VE_HOME must be separate, non-nested folders. Check all three selections and choose Verify runtime again.
Download failed	Check network access and retry. The EXE does not carry the R/RC7 payload. An offline installation requires the separately documented manual path.
Verification failed	Read the Runtime page's failing path or check. Do not run models until the certified RC7 runtime verifies; preserve the old folders while troubleshooting.
